March 9, 1970.

My dear Sreekantan,

I have just read with great interest the detailed account that you have sent me of the work carried out on the Extensive Air Shower experiments at Ootacamund over the past 10 years and the more recent programmes in X-ray Astronomy. An impressive amount of work has been carried out and results of considerable value obtained; this is clearly brought out in the overall account that you have sent me. I do think that there is very little known in the scientific world at large about the extent of detailed effort that has gone into the Ooty Air Shower programme and the significance of the results obtained. I think it is particularly important to publish all of this without much delay and to put a major effort into this. I also feel that the proposed new large Air Shower experiment is one that needs to be discussed seriously in view of its significance as well as the possibility that it can be effectively carried out by us. I am very glad that you have made this summary which I find most valuable.

With all good wishes,

Yours sincerely,

M.G.K. Menon.
