

Taking Zoology Education to the Common Man - The Salim Ali Way

Dr. Salim Ali
(November 12, 1896 - June 20, 1987)

"He is a small man, frail to look at, with a remarkable resemblance to a bird. His beak-like nose; the way his ears stick out; his voice, small and chirpy. There's an irrepressible quality about him. At 89, when most people prefer to call it a day and sit back to watch the sun set in the western sky amidst a blazing hue of red and gold, Salim Ali pursues his obsessions. With a fierce devotion."

Salim Ali Memorial Lecture
by **Dr. R. J. Ranjit Daniels,**
Care Earth - Chennai

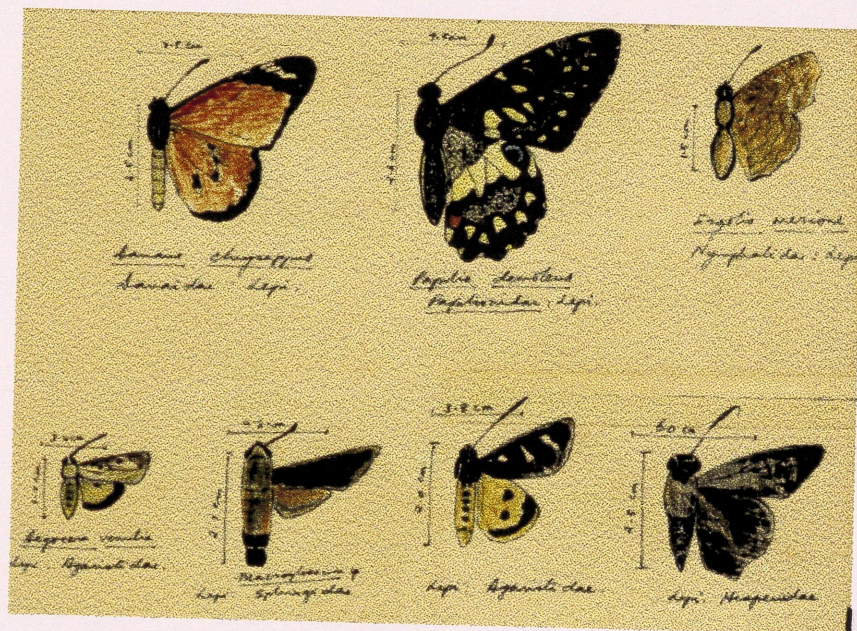

on **November 12, 2001** at
the **Zoological Survey of**
India 100, Santhome High
Road, Chennai 600 028

Time: 3. pm

Dr. P. T. Cherian,
Additional Director and
Officer-in-charge presides

All are welcome
Tea at 2.45 pm

“The first step in wisdom is to know the things themselves; this notion consists in having the true idea of the object; objects are distinguished and known by their methodical classification and appropriate naming; therefore Classification and Naming will be the foundation of our Science” - Linnaeus, 1735

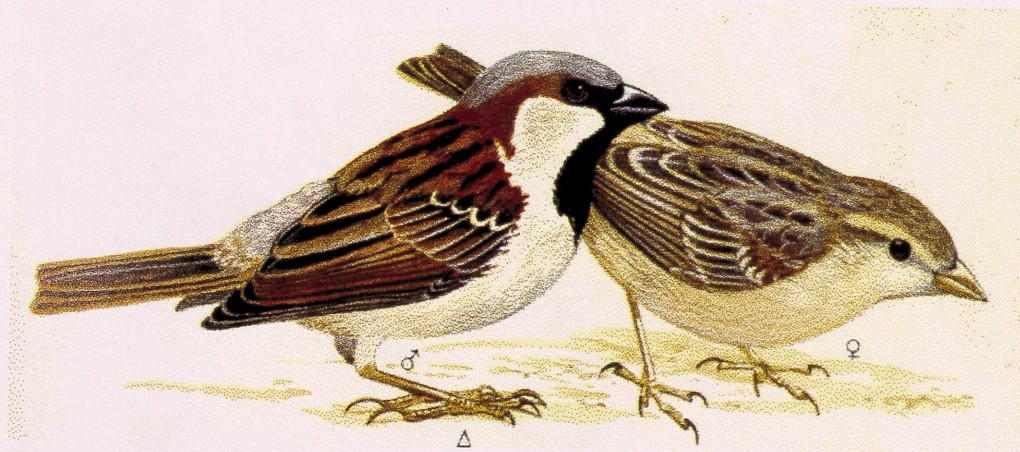

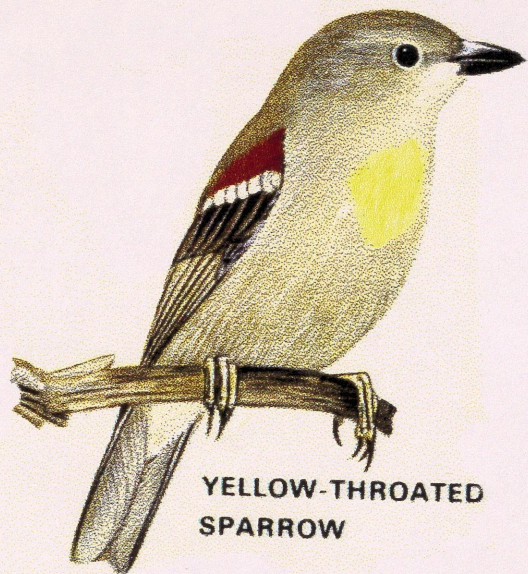

“More than 200 years after Linnaeus compiled his *Systema Naturae* and despite the efforts of at least 8 subsequent generations of systematists, literally millions of species remain undescribed; moreover there is increasing concern over whether we can discover and describe them before many go extinct.” - Describing Species, 1999

**From Sparrows to Weavers -
through pencil and paper**

“ The Cock-sparrow perched on the nail near the entrance to the hole, while the female sat inside on the eggs. I ambushed them from behind a stabled carriage and shot the male. In a very short while the female acquired another male who also sat ‘on guard’ on the nail outside. I shot this male also, and again in no time the female seemed to have another male in waiting who immediately stepped into the gap of the deceased husband”

The first notes of 10 year old Salim Ali in 1906/07

YELLOW-THROATED
SPARROW

Salim Ali first went to the Bombay Natural History Society soon after this...this time with an yellow-throated sparrow.

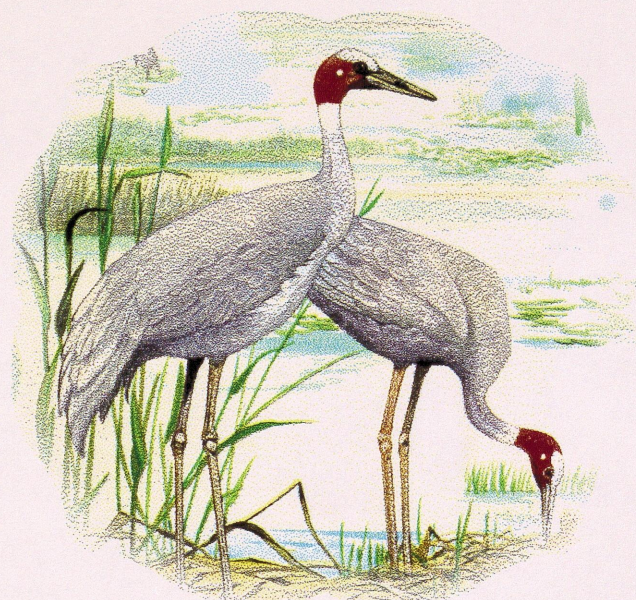

He later wrote “ the yellow-throated sparrow opened up un-dreamt vistas for me. Thenceforth my reading tended progressively towards books on general natural history, and particularly birds. Illustrated books on Indian birds were virtually non-existent in those days, and indeed for many years latter, and there was little available to help a beginner in identifying and learning about the birds around him”

Twenty years since then, his first scientific paper on the nesting of the Baya or Common Weaver Bird was published. And in 1941, the first edition of *The Book of Indian Birds* was available to the lay birdwatchers in India.

Was it coincidence or by choice ??

It was a set of closely related birds - sparrows and allies that marked the history of Indian field ornithology.

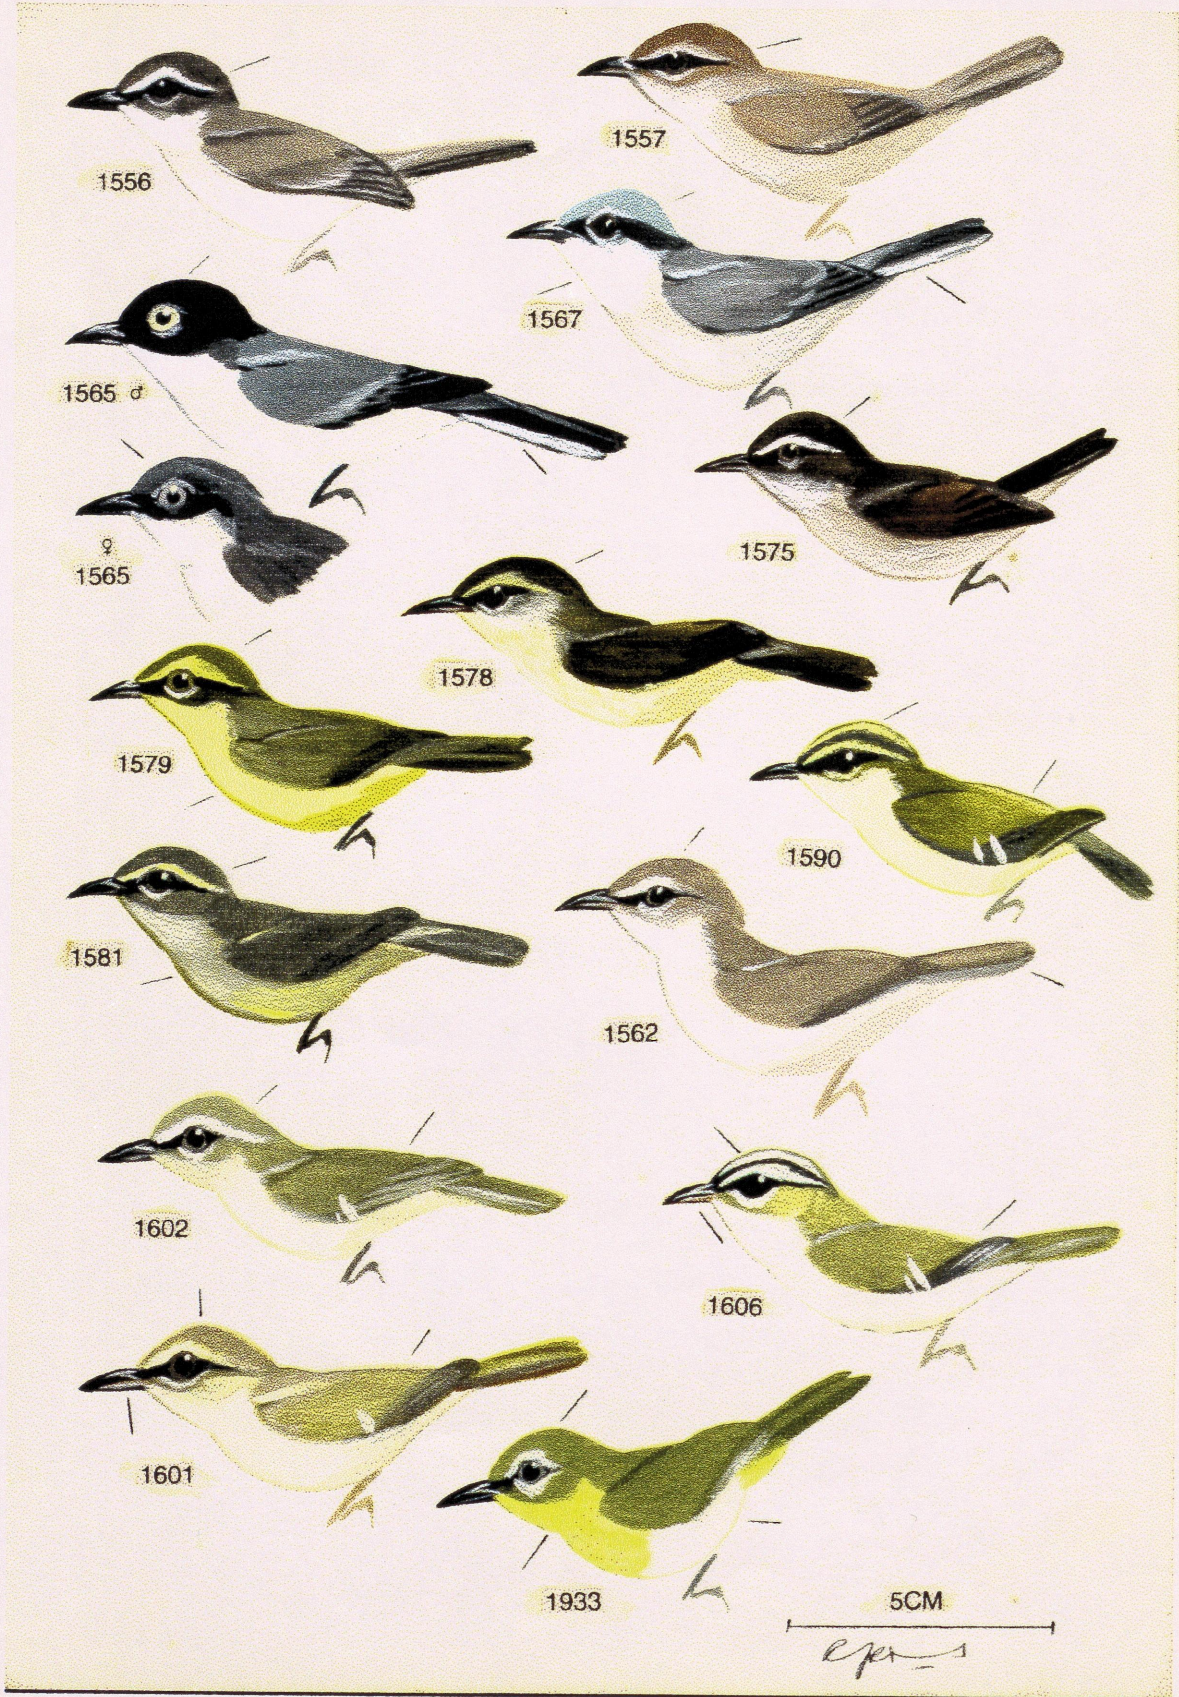

Mrign-Pakshi Sastra - The Science of Birds and Animals
by Hamsadeva (13th Century)

Description of a Sarus Cranes

“ they are very tall, having long legs, red beaks and white bodies. Their stomach and rear portions are stout. Their wings are broad and big. They are a little impatient when they are hungry. They eat small fish, fruits, lotus trunks and roots and others. They often dive in water and play. They generally enjoy during nights. They fly in the sky with their couples. They perch on the cool trees at the time of wearisome. They are much afraid of the roar of lions and tigers and they run away to distant places. They are fond of swimming even in the floods and they have smooth feathers. They have a little passion...”

Extracted from Asad Memorial Lecture of Salim Ali - 1978

Warblers

Greenish Leaf Warbler

Feeds actively in canopy, sometimes in undergrowth, also makes flycatcher-like flights to take insects.

*Solitary or in mixed flocks - John Harrison
(A Field Guide to the Birds of Sri Lanka (1999))*

*Usually met with singly, sometimes among mixed foraging parties of small insectivorous birds, feeding mostly in the foliage canopy but also in undergrowth, bustling energetically among leaves and blossoms, clinging to sprigs upside down, nervously flicking wings, and at times launching into the air to seize a midge like a flycatcher - Ali and Ripley
(Handbook of the Birds of India and Pakistan
(1968-1975))*

The subjects of science need not necessarily be only charismatic species. Common wayside birds, as that of sparrows do offer a lot for us to learn.

“Salim Ali’s scientific work was grounded in careful, painstaking observation and recording of events in the living world. This was entirely novel on the Indian scene.”

In Salim Ali’s words, many facets of the study of the diversity of this life require little beyond “a pair of field glasses, pencils, paper and patience”

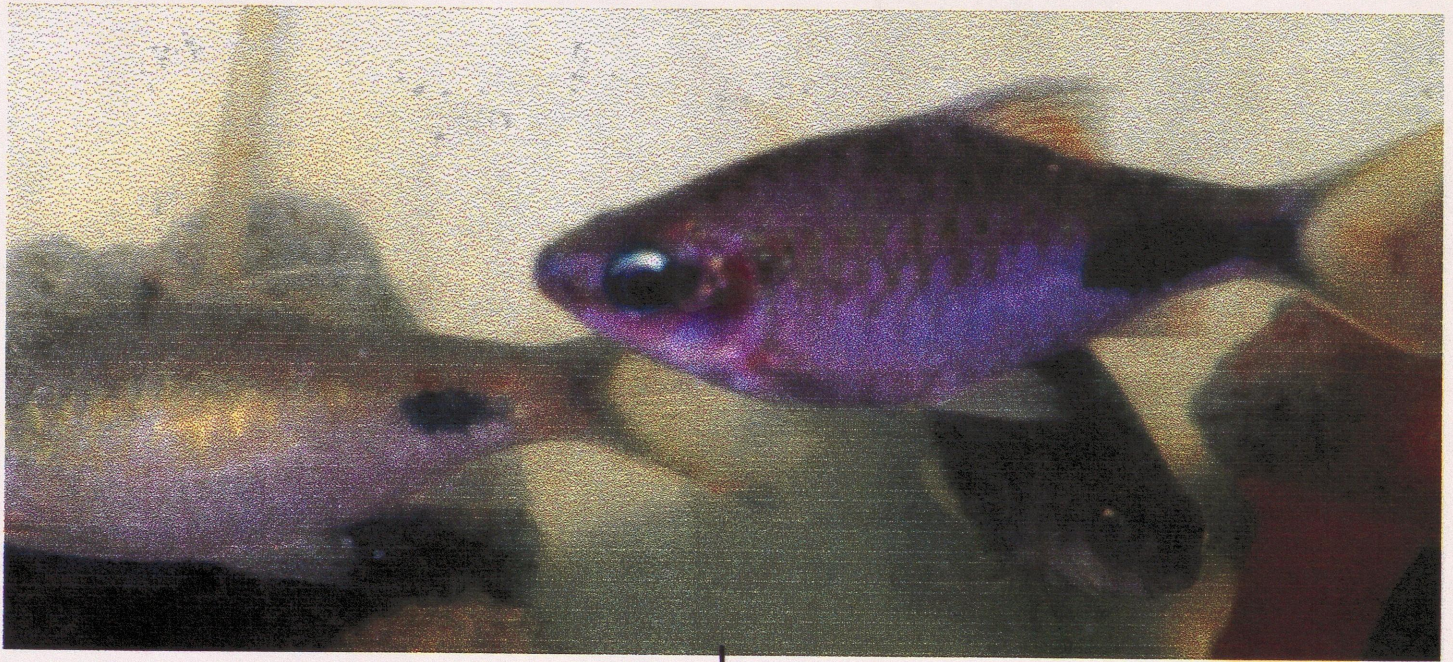

- Madhav Gadgil

Puntius filamentosus

Puntius mahecola

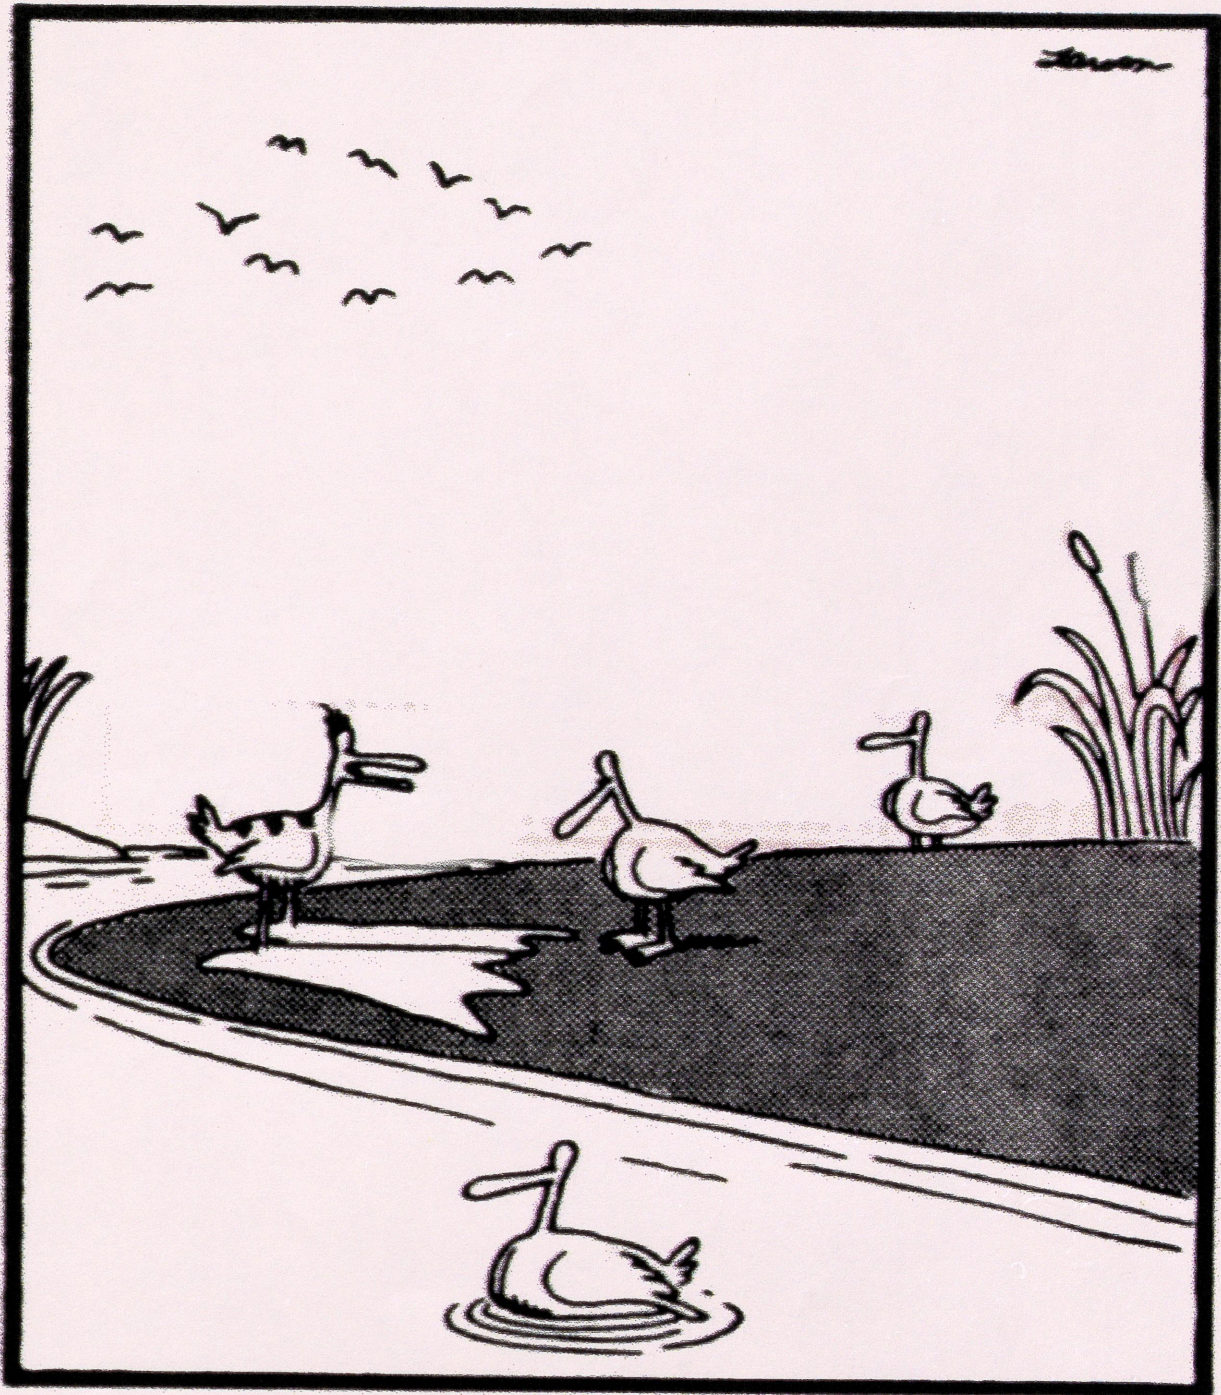

P. filamentosus

P. mahecola

Juv. Tail pattern with red and black as adults
 Female slender, black spot not reaching tail, dorsal fin blackish
 Male dorsal blackish, green on shoulder pronounced, pectoral brownish, pelvic blackish, anal clear, fifth ray of dorsal fin longest

Juv. Tail with red and black borders
 Female deep bodied, black spot reaching tail, dorsal fin red
 Male dorsal red with black filaments, green on shoulder less pronounced, pectoral red, pelvic clear, anal bordered red, third ray of dorsal fin longest

The Far Side by Gary Larson

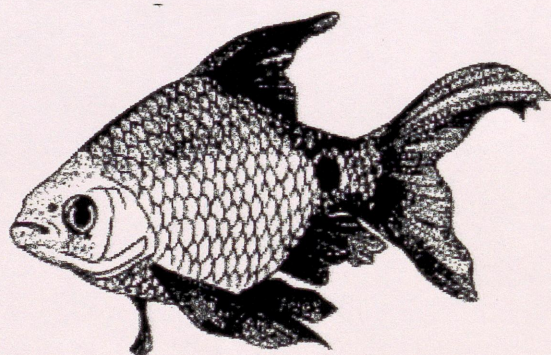

**"I'm one of those species they describe
as 'awkward on land.'"**

“Along with his many scientific contributions Salim Ali will be remembered for a whole series of superbly written and illustrated books on Indian Birds, books that played a key role in stimulating popular interest in India’s rich living heritage.

In celebration of the birth centenary of this great naturalist, the Indian Academy of Sciences, has launched the project ‘Lifescape’ as part of its initiative to enhance the quality of science education. This project aims to publish illustrated accounts of 1500 Indian species of microorganisms, plants and animals.... These accounts would also help create popular interest in the broader spectrum of India’s biological wealth, much as Salim Ali’s books have done for birdlife over the last fifty years.”
